

END-TO-END CAPABILITY CHECK

Presentation Capability Acceptance Report

Bilingual sample · Native editability · Multi-format
delivery

2026.08.13

One pipeline covers creation, rendering, and delivery

A shared content manifest drives both language versions and limits semantic drift across formats.

ONE SOURCE · TWO LANGUAGES · FOUR FORMATS

Native PPTX	Editable text, chart, table, and process shapes	PASS
Desktop render	PowerPoint exports every slide to PNG and PDF	PASS
Browser deck	Offline HTML, keyboard navigation, and print CSS	PASS
AI hero	Generated, inspected, embedded, and crop-checked	PASS

Key content stays structured and reusable

The chart and table are not screenshots. All scores are synthetic QA data used to verify bilingual parity.

5

**Five content types
share one source**

Synthetic QA data
One JSON manifest

Every format has an independent stopping rule

Build, render, inspect, repair, and revalidate form a closed loop; an unexecuted check never receives PASS.

Output	Verification	Expected
Editable PPTX	Native text, chart, table, and shapes	PASS
PowerPoint PDF	Desktop render and five-page parity	PASS
Standalone HTML	Offline open and keyboard navigation	PASS
Web PDF	Playwright print and five-page parity	PASS

READY

CORE PRODUCTION PIPELINE

The static production pipeline is fully testable

PPTX, PowerPoint PDF, HTML, and Web PDF enter delivery only after real generation and page-by-page inspection.

Static content and delivery: PASS

Motion visual regression: PARTIAL

Animation structure and slideshow launch are testable; without video capture, motion visual regression is not claimed.
